GUIDELINES FOR LIFE CYCLE COST ANALYSIS Life cycle costing, or whole-life costing, is the process of estimating how much money you will spend on an asset over the course of its useful life. Whole-life costing covers an asset's costs from the time you purchase it to the time you get rid of it. Buying an asset is a cost commitment that extends beyond its price tag. Life Cycle Costing | Definition, Process, Example, & More Performing a life-cycle cost analysis (LCC) gives the total cost of a lighting system—including all expenses incurred over the life of the system. This analysis can be applied not only to lighting but for most of the appliances, automobiles, heating systems, and so on, when two systems are compared to determine the most cost effective options. Life Cycle Cost Analysis | EGEE 102: Energy Conservation ... Basic LCCA analyses that determine life-cycle costs based on the most likely input parameters (e.g., the most likely labor costs, material costs, construction times, rehabilitation intervals, etc.) are called deterministic. Based on the assumed input values there is one and only one output value. Life-Cycle Cost Analysis - Pavement Interactive Life Cycle Costing (LCC) is an important economic analysis used in the selection of alternatives that impact both pending and future costs. It compares initial investment options and identifies the least cost alternatives for a twenty year period. 1.8 Life Cycle Costing | GSA Life cycle cost (LCC) is 'cost of an asset, or its parts throughout its life cycle, while fulfilling the performance requirements'.
