Tools for Thought in a Helping Profession

Oxford University Press
This edited collection offers an original critical clinical approach to social work practice, written by social work educators from the School of Social Work at Dalhousie University and their collaborators. It provides a Canadian perspective on the diverse issues social workers encounter in the field, highlighting the practical application of feminist, narrative, anti-racist, and postcolonial frameworks. With the aim of producing counterstories that participate in social resistance, this volume focuses on integrating

critical theory with direct clinical practice. Through the use of case studies, the contributors tackle a range of substantive issues including ethics, working with complex trauma, men's use of violence, substance use among women and girls, Indigenous social work praxis, critical child welfare approaches, counterstorying experiences of (dis)Ability, and animal-informed social work practice.

Created to help scientists and engineers write computer code, this practical book addresses the

important tools and techniques that are necessary for scientific computing, but which are not yet commonplace in science and engineering curricula. This book contains chapters summarizing the most important topics that computational researchers need to know about. It leverages the viewpoints of passionate experts involved with scientific computing courses around the globe and aims to be a starting point for new computational scientists and a reference for the experienced. Each contributed chapter focuses on a specific tool or skill, providing the content needed to provide a working

knowledge of the topic in about one day. While many individual books on specific computing topics exist, none is explicitly focused on getting technical professionals and students up and running immediately across a variety of computational areas. *Visual Basic .NET at Work* Entrepreneur Press

Management and
administrative
processes within the
construction industry
have been undergoing
major changes in the
last several decades.
These changes have
involved significant
adjustments in
management science
and manage ment

techniques, brought about by the need for contemporary valid information with which to manage the construction process. In short, management in the construction industry is changing significantly; change will continue at an accelerated pace at least through the next decade. The responses required of construction industry management are now resulting in a movement away from an entrepreneurial management style to professional management techniques and procedures.

THE COMPELLING ECONOMIC ISSUES The issues forcing these changes are economic. The rising costs of construction and of money are forcing the buyers of construction

services to be more demanding. Their demands are for more construction economies, more production, and more productivity than at any time in the past. Nowhere has this been more evident than in the Business Roundtable on construction and in the response of the construction industry to it. To be successfully responsive, management in the construction industry will be required to use the best project management methods available for cost control, schedule control, and for financial and accounting controls. But responsive professional management can survive and will flourish

within this more demanding economic environment.
